RISK

7

Balanced to Speculative Investor

You are aiming for higher long term returns and accept significant fluctuations in value. You accept the risk of a moderately significant loss.

*Potential return of 33.63%
& potential loss of -21.25%*

SPECULATIVE BETA PORTFOLIO

EDITION 28 January 2018

The Speculative Beta Portfolio is a passive growth strategy. It is aimed at medium to long term investors who are seeking above average capital growth from a balanced portfolio of mainly equity investments.

The chosen investment funds can invest in UK and overseas equities, commercial property, cash and fixed interest securities. Passive funds replicate the stockholdings of an underlying index. Since these funds track the composition and performance of the underlying index, there are low levels of human involvement and so the funds have a lower total expense ratio.

The Speculative Beta Portfolio performance is benchmarked against the average performance of the IA Mixed Investment 40%–85% sector and has a risk rating and investor profile of 7 out of 10.

RISK

Potential return of 33.63%

Prospective Risk Level

Historic Risk Level

A **risk level 7** investor should be prepared to accept annual returns somewhere **within the range of a -21.25% loss and a 33.63% gain** — returns within this range would be expected 95% of the time. It should be remembered that there is a 5% chance that **risk level 7** portfolios will experience an annual return outside this range — this means an investor may experience **losses greater than -21.25% or gains greater than 33.63%** at some point(s) during their investment in one year.

It is important to remember the figures are not intended to be and should not be taken as a projection of the likely returns from the portfolio risk levels. This is intended to support the risk discussion between an adviser and a client following the completion of a risk profile questionnaire. They show the implied volatility and mean expected return of risk levels 1 to 10 to two standard deviations in one year (ie all returns are expected to be between these extremes in 95 years out of 100; this is often described as a 95% confidence level). The figures shown are the expected arithmetic average returns and the ranges assume that returns are based on a log normal distribution. Figures are shown net of tax and underlying manager fees.

Range of Returns

Upper Return

33.63%

In 95 years out of 100, this is the highest expected level of return for a given level of risk. There is a 2.5% chance that returns could fall outside the upper return figure in one year.

Average of All Returns

6.19%

This is the average of all possible returns within a risk level in one year.

Lower Return

-21.25%

In 95 years out of 100, this is the lowest expected level of return for a given level of risk. There is a 2.5% chance that returns could fall outside the lower return figure in one year.
